GOALS’ LAB STUDY (2019-2021)
Background and goal

• Adolescent transition from middle school to high school requires increasing capacity to formulate and pursue personal goals.

• Personal identity may serve as a resource for pursuing personal goals:
  – Identity functions include directing attention, filtering and processing information, managing impression, and selecting relevant behaviors (Adams & Marshal, 1996).
  – It is conceptualized as a socio-cognitive structure, which is part of the self-regulation system of a person (Berzonsky, 1994, 2011);

• Thus, our goal was to assess the links between adolescent identity formation and goal regulation strategies over the first year of high school.

GOALS’ LAB STUDY (2019-2021)
Socio-cognitive perspective on goal regulation

Goal systems approach (Karoly, 1999; Karoly & Ruehlman, 1995; based on Ford’s transactional model of adaptive control systems (1987):

- Directive
  - Value
  - Self-efficacy

- Regulatory
  - Social comparison
  - Self-monitoring

- Arousal
  - Positive affect
  - Negative affect

- Control
  - Planning
  - Self-criticism
  - Self-reward

GOALS’ LAB STUDY (2019-2021)
Socio-cognitive perspective on identity

- Information-oriented
- Normative
- Diffuse-avoidant

Bosch & Card, 2012
Research question

To which extent are the differences in the use of identity processing styles related to the differences in goal regulation, specifically, to the differences in goal regulation changes over a school year?
Goals Lab study design

- School-based online assessment
- Mixed-quota sampling of municipalities and schools (SES x achievement)
- 36 gymnasiums across Lithuania (6 in a major city, 21 urban, 9 non-urban)
Participants

• T1 & T2 participants of a longitudinal *Goals Lab* study
• **1268** adolescents (51.7% females)
• Age 14 - 16 (M = 14.87 SD = 0.39) at T1
• Diverse family and socio-economic background:
  • 67% live with two parents; 22% parental divorce, 4% parental loss, 4% migration
  • 12.9% receive social support (free nutrition at school) (on a national level – 13.7%)
• Homogenous ethnically (> 98% Lithuanian)
## Instruments

### Predictor T1: Identity processing styles inventory (ISI) (Berzonsky, 2015)

<table>
<thead>
<tr>

Analyses

Cross-lagged model

• To which extent do initial (T1) differences in the use of identity styles predict relative change in goal regulation over a school year (T1/T2)?
  Otherwise, to which extent do initial differences in identity styles predict how much one has changed in relation to others in goal regulation?
Results: Cross-lagged model

GOALS’ LAB STUDY (2019-2021)
Conclusions and limitations

How adolescents approach their self-related issues contributes to how they pursue their personal goals over the 1st year of high school:

- Higher reliance on *information-oriented and, especially, normative* identity processing style at the beginning of a school year predicts a relative *increase* in the use of a number of goal regulation strategies over a school year.

- Higher reliance on *diffuse-avoidant* identity style at the beginning of a school year predicts a relative *decrease* in the use of a number of goal regulation strategies over a school year.

Favorable formation of identity may be an important resource for adolescents in pursuing their goals.

More extended longitudinal design is necessary to better understand the directionality of the effects.

GOALS’ LAB STUDY (2019-2021)
Acknowledgements

This presentation is based on data collected under the research project “The development of adolescent personal goals in the context of social inequality (PaNel)”. The project is funded by the Research Council of Lithuania (grant agreement S-MIP-19-26).
